

NINJA 800 EXPERT

NINJA 800 Expert is the new addition to the BALFOR family, a truly mobile firewood production plant. Thanks to its great versatility, NINJA 800 Expert can work on all types of wood, branches and logs. By opening or closing the log selector, positioned after the splitting blade, the operator decides whether the wood should fall directly into the belt or whether it should be taken up for splitting. The log splitter has 16 tons of power and has a robust hydraulic wedge with two interchangeable splitting wedges. The wide conveyor belt with three hydraulic extensions enables fast and efficient evacuation of all the wood to be processed by the machine. The logs are fed in via a conveyor belt, and the advancement of the 800 mm WIDIA blade is fully hydraulic. The operator therefore only has to operate the levers as in all firewood systems. Since it is all hydraulic, maintenance is reduced to a minimum, and to prevent overheating, an oversized tank combined with a large oil cooler was chosen. NINJA 800 Expert is already equipped with log deck connections for maximum automation of the process.
